A holder (100) for medical implements includes a base member (101) and at least one medical implement receiver (110). Each medical implement receiver (110) includes a pair of retention members (114,115) extending from the base member (101). Opposing faces (116,117) of the retention members (114,115) define an implement receiving recess (118). Slots (120,121) are provided in the opposing faces (116,117) to facilitate reception of syringe needle cap rims (330). The holder (100) can be configured as a medical tray (801) that can be attached to one or more other medical trays, including one having cup holders (870,871,872), one including a needle containment receptacle (881), or other medical trays.
